
Abstract:
The second report of “Conservation of Earthen Architecture” showed the difficulties in conservation of earthen architecture in the tropical condition. The third report presents the laboratory and site experiments on the capping materials amended with synthetic polymers (dispersible powered EVA), and the conservation trials in the archaeological site of La Joya between 2009-2011 by the research group of Annick Daneels (IIA-UNAM). The construction materials and system of the main pyramid are also explained.
